Executive Summary

The Sizland Land Acquisition System is a state-of-the-art blockchain platform designed to digitize property transactions. By leveraging a Notary-Mediated workflow, it provides cryptographic security for fund releases while maintaining legal integrity through trusted mediation.

System Architecture

Architectural Flow

Detailed 4-Phase Workflow

Phase 1: Intake Discovery

◇ **Onboarding**: Client provides purchase parameters.

◇ **Gallery**: Treasury uploads drone shots, GPS pins, and property vitals.

◇ **Selection**: Client locks the specific plot for the DD process.

State Transition: Intake → Discovery → PlotSelected

Phase 2: Due Diligence (DD)

◇ **Funding**: Client deposits full ETH budget into the MultiSig vault.

◇ **Verification**: Notary performs search and valuation, uploading reports to IPFS.

◇ **Confirmation**: Client reviews and cryptographically signs off on DD.

State Transition: PlotSelected → DueDiligencePending → DueDiligenceComplete

Phase 3: Transaction Execution

◇ **Rates**: Notary sets final KES/ETH conversion and facilitation fees.

◇ **Signing**: Seller and Client sign the smart-legal contract.

◇ **Settlement**: Notary executes the fiat-bridge trigger.

State Transition: DDComplete → ExecutionPending → ExecutionComplete

Phase 4: Transfer Completion

◇ **Lodgement**: Notary registers the deed at the Lands Registry.

◇ **Finalization**: Title hash is recorded; courier tracking is provided.

◇ **Release**: Smart contract automatically releases fees and final funds.

State Transition: TransferRegistry → Completed

Security Resilience

The system is built on a "Defense in Depth" principle:

- **ReentrancyGuard**: Prevents recursive call exploits on all fund functions.
- **Compositional Security**: Logic is decoupled from the asset vault (MultiSig).
- **Role-Based Access**: Strict `onlyNotary` and `onlyClient` modifiers.
