Sizland Land Acquisition Ecosystem

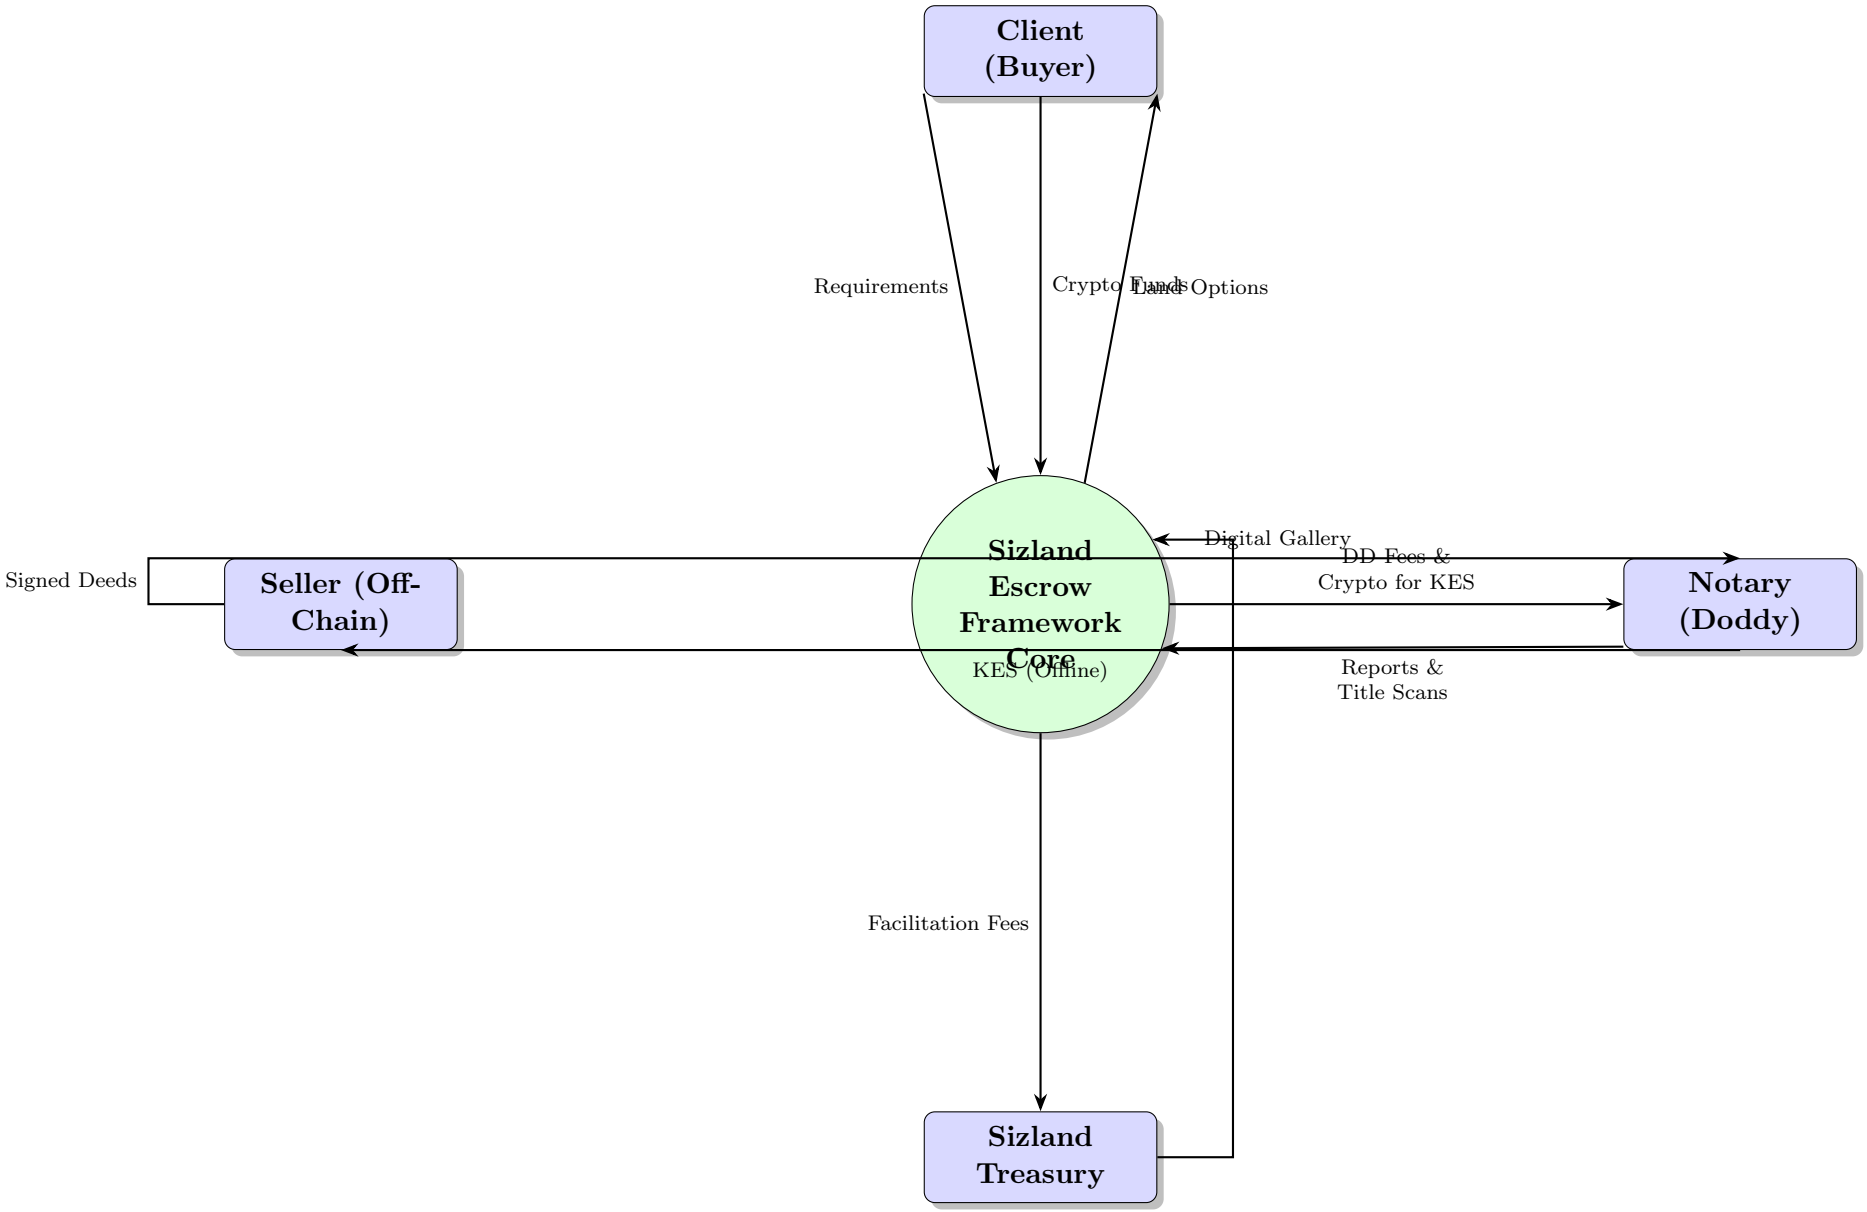

Data Flow Diagram (DFD) Specification

System Overview

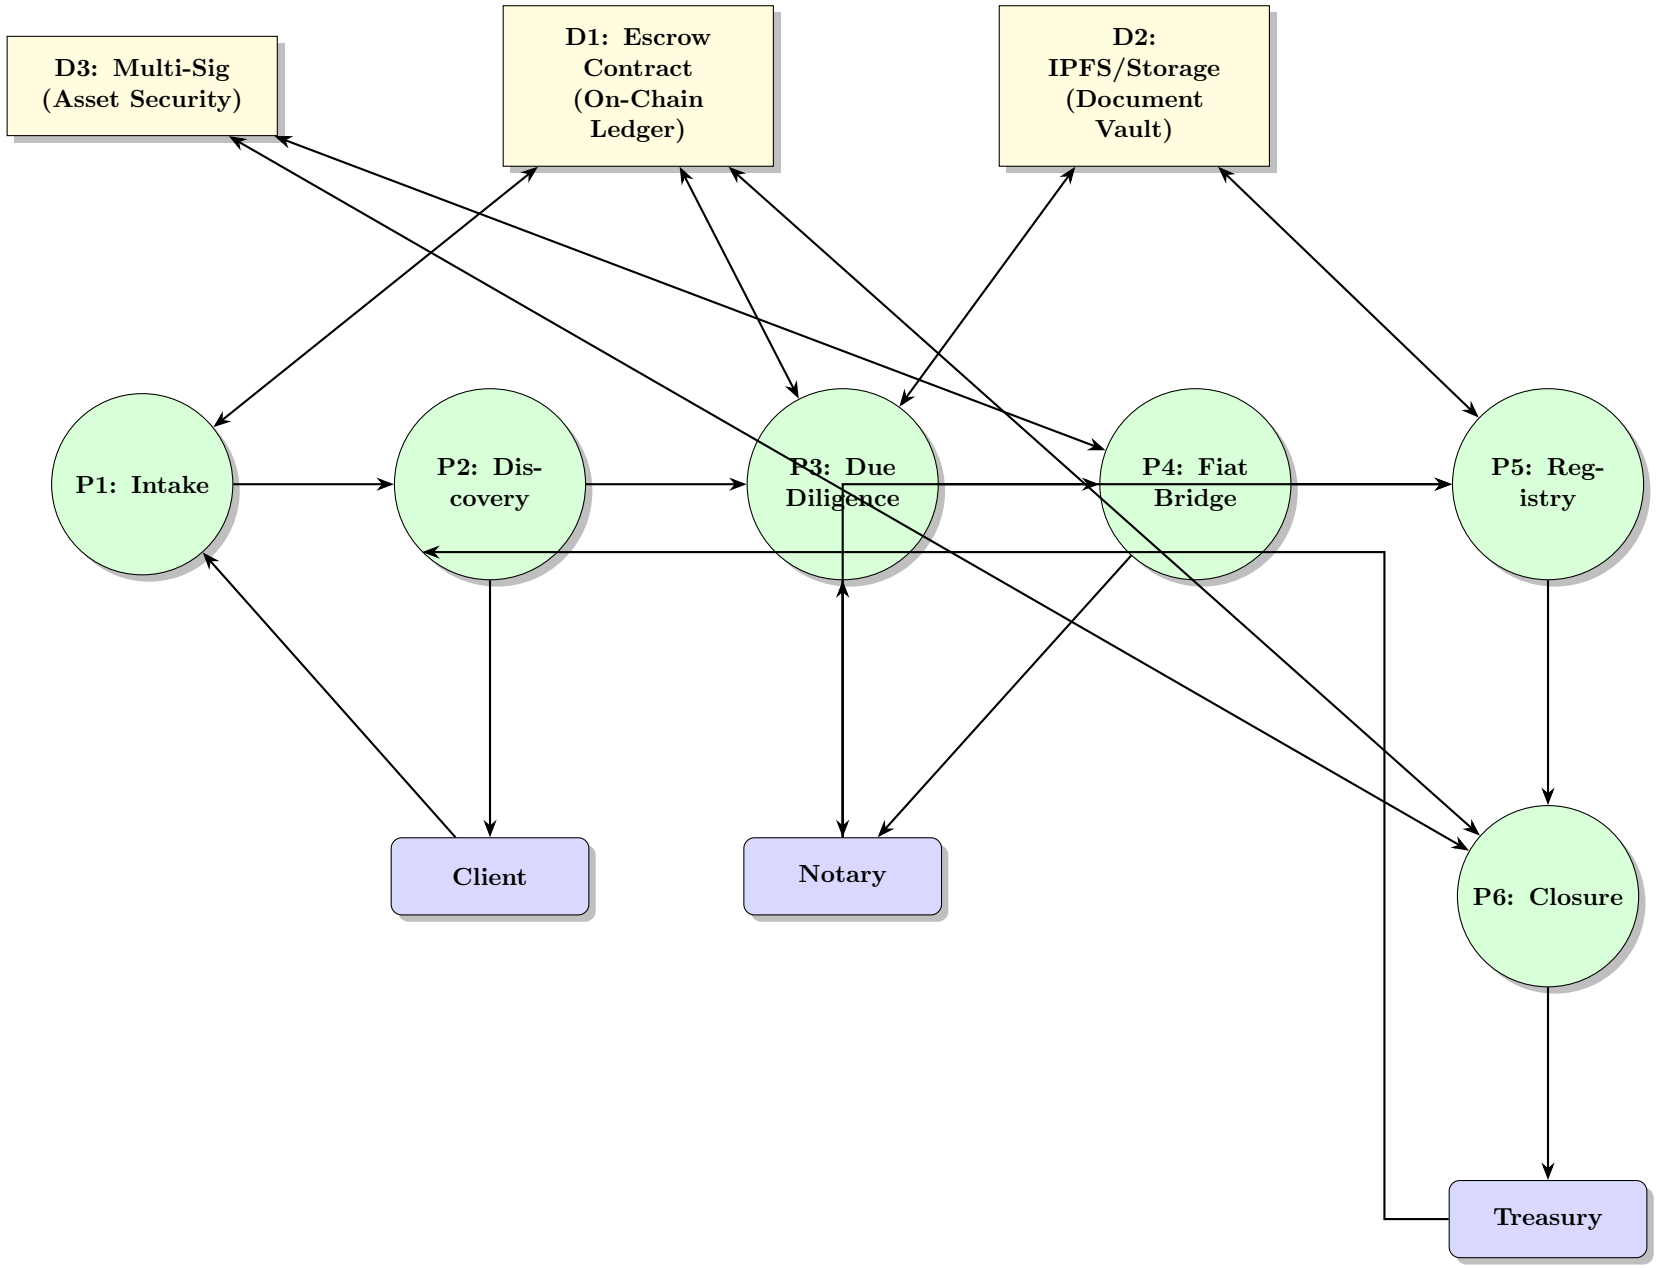

This document provides a visual mapping of information flows, actors, and data persistence in the Sizland Notary-Mediated Escrow System. It outlines how cryptographic assets transition into physical land titles through a series of secure, mediated processes.

Version 1.2 - Final Architecture

Actor and Data Store Definitions

Data Stores

D1: Escrow Contract The immutable source of truth. Stores state, financial rates, and document hashes.

D2: IPFS/Storage Decentralized storage for large files such as DD reports, site photos, and title scans.

D3: Multi-Sig Wallet A 2-of-3 secure vault holding crypto assets until specific legal milestones are reached.

System Processes

P1: Intake Initializing the escrow by capturing client budget, preference, and purpose.

P2: Discovery presenting matched land options and managing client selection.

P3: Due Diligence Notary-led legal verification and physical site inspection.

P4: Fiat Bridge Conversion of cryptocurrency to KES and offline payment to the seller.

P5: Registry Legal lodgement and registration of transfer at the Land Registry.

P6: Closure Facilitation fee release and courier delivery of the physical title.

This architecture ensures on-chain transparency while maintaining real-world legal validity.
