1 Introduction

SafeShamba is a secure land purchase platform that uses blockchain technology and multisig custody to protect your transactions. It functions as a digital escrow service where funds are held securely until all conditions are met.

2 How It Works

SafeShamba operates through a four phase workflow:

1. **Intake and Discovery** – You submit your land requirements
2. **Safety Gate** – Due diligence and document verification
3. **Execution and Fiat Bridge** – Funds are released through secure channels
4. **Transfer Registry** – Title transfer and completion

3 Getting Started

3.1 Prerequisites

- A Web3 wallet such as MetaMask or WalletConnect
- Testnet ETH on Sepolia
- A modern web browser

3.2 Step 1: Connect Your Wallet

Open SafeShamba in your browser. Click the Connect wallet button in the top right corner. Approve the connection in your wallet. Your address will appear in the status badge.

3.3 Step 2: Set Up the Factory

If you are deploying fresh, obtain testnet ETH from the Sepolia faucet and run the deployment script:

```
npx hardhat run scripts/deploy.js --network sepolia
```

Copy the EscrowFactory address and paste it into the Factory field on the left side of the application.

3.4 Step 3: Load an Escrow

Paste the escrow contract address into the Escrow field. Click the Load escrow button. The system will display the current state and your role within the transaction.

4 Using SafeShamba

4.1 Client Actions

If you are purchasing land, you can perform the following actions:

- Select plot – Choose the land plot during the discovery phase
- Fund escrow – Deposit ETH into multisig custody
- Verify document – Confirm due diligence documents
- Proceed with purchase – Move to the execution phase
- Cancel – Cancel before execution to enable a refund

4.2 Notary Actions

If you are acting as the legal notary, you can perform the following actions:

- Upload document – Submit document hashes to the blockchain
- Set rates – Configure deposit and facilitation fee percentages
- Execute fiat bridge – Process currency conversion
- Upload lodgement receipt – Submit registry documents
- Complete transfer – Finalize the transaction

4.3 Multisig Owner Actions

If you are part of the multisig group, you can perform the following actions:

- Submit authorized release – Approve fund releases
- Purpose selection – Choose between DD fee, facilitation, or refund

5 Release Authorization

SafeShamba uses state gated releases. Funds can only be released when the workflow permits it:

- DD Fee – Released after funding, paid to Treasury
- Facilitation Fee – Released after completion, paid to Treasury
- Refund – Released after cancellation, paid to Client
- Seller Proceeds – Released after completion, paid to Seller

6 Pricing

Our pricing is designed to be accessible and fair:

- Free tier – Create and manage escrows at no cost
- 0.5 percent facilitation fee – Only applied on completed transactions
- No monthly fees – Pay only when you transact
- Volume discounts – Increasing savings as your transaction volume grows
- Revenue share – 20 percent of facilitation fees for distribution partners

7 Security

- Never share your private key with anyone
- Always verify contract addresses before interacting
- Use hardware wallets for large transactions
- Test on Sepolia before deploying to mainnet
- Report vulnerabilities to security@safeshamba.com
